
What's New in Python

リリース 3.8.20

A. M. Kuchling

9月 08, 2024

目次

1	概要 -- リリースハイライト	4
2	新しい機能	4
2.1	代入式	4
2.2	位置専用引数	5
2.3	コンパイル済みのバイトコードファイルのキャッシュを併存させるファイルシステム	6
2.4	デバッグビルドとリリースビルドの ABI 共通化	6
2.5	<i>f-string</i> での = を用いたオブジェクトの表現	7
2.6	PEP 578: Python ランタイムの監査フック	8
2.7	PEP 587: Python 初期化設定	8
2.8	Vectorcall: CPython のための高速なプロトコル呼び出し	9
2.9	Pickle プロトコルバージョン 5 による帯域外データバッファ	10
3	その他の言語変更	10
4	新たなモジュール	13
5	改良されたモジュール	13
5.1	ast	13
5.2	asyncio	14
5.3	builtins	15
5.4	collections	16
5.5	cProfile	16
5.6	csv	16
5.7	curses	16
5.8	ctypes	16
5.9	datetime	17

5.10	functools	17
5.11	gc	18
5.12	gettext	18
5.13	gzip	18
5.14	IDLE と idelelib	19
5.15	inspect	19
5.16	io	20
5.17	itertools	20
5.18	json.tool	20
5.19	logging	20
5.20	math	21
5.21	mmap	22
5.22	multiprocessing	22
5.23	os	22
5.24	os.path	23
5.25	pathlib	23
5.26	pickle	23
5.27	plistlib	23
5.28	pprint	24
5.29	py_compile	24
5.30	shlex	24
5.31	shutil	24
5.32	socket	25
5.33	ssl	25
5.34	statistics	25
5.35	sys	26
5.36	tarfile	26
5.37	tempfile	26
5.38	threading	26
5.39	tokenize	27
5.40	tkinter	27
5.41	time	27
5.42	typing	27
5.43	unicodedata	28
5.44	unittest	28
5.45	venv	29
5.46	weakref	29
5.47	xml	29
5.48	xmlrpc	30

7	ビルドならびに C API の変更	31
8	非推奨	33
9	API と機能の削除	35
10	Python 3.8 への移植	36
10.1	Python の挙動の変更	36
10.2	Python API の変更	37
10.3	C API の変更	39
10.4	CPython バイトコードの変更	41
10.5	Demos and Tools	42
11	Python3.8.1 での重要な変更点	43
12	Python3.8.2 での重要な変更点	43
13	Notable changes in Python 3.8.3	43
14	Python3.8.8 での重要な変更点	44
15	Notable changes in Python 3.8.9	44
16	Notable changes in Python 3.8.10	44
16.1	macOS 11.0 (Big Sur) と Apple シリコンの Mac のサポート	44
17	Notable changes in Python 3.8.10	44
17.1	urllib.parse	44
18	Notable changes in Python 3.8.12	45
18.1	Python API の変更	45
19	Notable security feature in 3.8.14	45
20	Notable Changes in 3.8.17	45
20.1	tarfile	45
21	Notable changes in 3.8.20	45
21.1	ipaddress	45
21.2	email	46
	索引	47

この記事では 3.7 と比較した Python 3.8 の新機能を解説します。全詳細については changelog をご覧ください。

Python 3.8 は 2019 年 10 月 14 日にリリースされました。

1 概要 -- リリースハイライト

2 新しい機能

2.1 代入式

大きな構文の一部として、変数に値を割り当てる新しい構文 `:=` が追加されました。この構文は `セイウチの目と牙` に似ているため、「セイウチ演算子」の愛称で知られています。

以下の例では、代入式により `len()` 関数を二重に呼びだすことを回避しています:

```
if (n := len(a)) > 10:
    print(f"List is too long ({n} elements, expected <= 10)")
```

同様の利点が、マッチがしたかどうかの判定とサブグループの取得とで 2 回マッチオブジェクトが必要になる、正規表現によるマッチでも、発揮されます:

```
discount = 0.0
if (mo := re.search(r'(\d+)% discount', advertisement)):
    discount = float(mo.group(1)) / 100.0
```

この演算子は、生成した値をループ終了の判定とループ本体の両方で使用するような `while` 文においても、有用です:

```
# Loop over fixed length blocks
while (block := f.read(256)) != '':
    process(block)
```

動機となったもう 1 つのユースケースは、リスト内包表記においてフィルター条件の中で計算した値が式の本体でも必要になるところから出てきます:

```
[clean_name.title() for name in names
 if (clean_name := normalize('NFC', name)) in allowed_names]
```

セイウチ演算子の使用は、複雑さを減らしたり可読性を向上させる綺麗なケースに限るよう努めてください。

完全な説明は [PEP 572](#) を参照してください。

(Emily Morehouse の貢献による [bpo-35224](#))

2.2 位置専用引数

関数の引数が位置引数として指定されねばならずキーワード引数としては指定できないことを表す、新しい構文 `/` を追加しました。この構文は、`help()` で Larry Hasting の [Argument Clinic](#) でアノテートした C 関数を表示したときと同じ表記です。

以下の例では、引数 *a* と *b* が位置専用、*c* と *d* が位置引数でもキーワード引数でも可、*e* と *f* はキーワード引数専用です:

```
def f(a, b, /, c, d, *, e, f):  
    print(a, b, c, d, e, f)
```

以下は正しい関数呼び出しです:

```
f(10, 20, 30, d=40, e=50, f=60)
```

一方、以下は不正です:

```
f(10, b=20, c=30, d=40, e=50, f=60)    # b cannot be a keyword argument  
f(10, 20, 30, 40, 50, f=60)           # e must be a keyword argument
```

One use case for this notation is that it allows pure Python functions to fully emulate behaviors of existing C coded functions. For example, the built-in `divmod()` function does not accept keyword arguments:

```
def divmod(a, b, /):  
    "Emulate the built in divmod() function"  
    return (a // b, a % b)
```

もう一つのユースケースは、引数名が有用ではない場合にキーワード引数としての利用を排除することです。例えば組み込み関数 `len` は `len(obj, /)` というシグニチャです。これにより、以下のようなぎこちない呼び出しが排除されます:

```
len(obj='hello')    # The "obj" keyword argument impairs readability
```

引数を位置専用とすることは、のちに引数名を変更する際に呼び出し側のコードを壊してしまう心配がないという利点があります。例えば、`statistics` モジュールでは、`dist` という引数名が将来変更される可能性があります。これは、関数が以下のような定義だからこそ可能なことです:

```
def quantiles(dist, /, *, n=4, method='exclusive')  
    ...
```

Since the parameters to the left of `/` are not exposed as possible keywords, the parameters names remain available for use in `**kwargs`:

```
>>> def f(a, b, /, **kwargs):
...     print(a, b, kwargs)
...
>>> f(10, 20, a=1, b=2, c=3)           # a and b are used in two ways
10 20 {'a': 1, 'b': 2, 'c': 3}
```

これにより、任意のキーワード引数を受け取る関数やメソッドを定義するのが、ぐんとシンプルになります。例えば、これは `collections` モジュールから抜き出したコードです：

```
class Counter(dict):

    def __init__(self, iterable=None, /, **kwds):
        # Note "iterable" is a possible keyword argument
```

詳細は [PEP 570](#) を参照してください。

(Pablo Galindo の貢献による [bpo-36540](#)。)

2.3 コンパイル済みのバイトコードファイルのキャッシュを併存させるファイルシステム

暗黙のバイトコードキャッシュは、デフォルトでは各ソースコードのディレクトリ内の `__pycache__` サブディレクトリを使用しますが、新たに追加された環境変数 `PYTHONPYCACHEPREFIX`（またはコマンドラインオプション `-X pycache_prefix`）を指定すると、ソースコードと分離されたディレクトリツリーに格納されるようになります。

キャッシュの場所は `sys.pycache_prefix` で参照できます（`__pycache__` を使用する場合は `None` になります）。

(Carl Meyer の貢献による [bpo-33499](#))

2.4 デバッグビルドとリリースビルドの ABI 共通化

Python はリリースモード、デバッグモード両方のビルドにおいて、同じ ABI を用いるようになりました。Unix において、Python がデバッグモードでビルドされている場合、リリースモードで、あるいは安定 ABI を用いて、ビルドされた C 拡張モジュールを読み込むことができます。

リリースビルドとデバッグビルドは ABI 互換になりました。Py_DEBUG マクロを定義することは、ABI の非互換性を引き起こす、Py_TRACE_REFS マクロの定義を伴いません。sys.getobjects() 関数の定義や PYTHONDUMPREFS 環境変数を加えるような Py_TRACE_REFS マクロは、新しいビルドオプション `./configure --with-trace-refs` を有効にすることで利用できます。(Victor Stinner の貢献による [bpo-36465](#))

Unix においては、Android と Cygwin を除き、C 拡張モジュールは libpython にリンクされなくなりました。静的リンクされた Python は、Python 共有ライブラリを用いてビルドされた C 拡張モジュールを読み込みます。(Victor Stinner の貢献による [bpo-21536](#)。)

Unix において、Python がデバッグモードでビルドされている場合、インポート (import) は、リリースモードで、あるいは安定 ABI を用いて、ビルドされた C 拡張モジュールを探すようになりました。(Victor Stinner の貢献による [bpo-36722](#).)

Python をアプリケーション内に組み込むためには、新しい `--embed` オプションを有効にして `python3-config --libs --embed` とすると、`-lpython3.8` を有効にできます。(アプリケーションが `libpython` にリンクされます) Python3.8 以前との互換性を保つためには、`python3-config --libs --embed` をまず試みてから、失敗した場合 `python3-config --libs` (`--embed` なし) にフォールバックしてください。

Python をアプリケーションに組み込むために、`python-3.8-embed` pkg-config モジュールが追加されました: `pkg-config python-3.8-embed --libs` の出力は、`-lpython3.8` を含みます。Python3.8 以前との互換性を保つためには、`pkg-config python-X.Y-embed --libs` をまず試みてから、失敗した場合 `pkg-config python-X.Y --libs` (`--embed` なし) にフォールバックしてください。(X.Y を使用する Python のバージョンに置き換えてください)

一方で、`pkg-config python3.8 --libs` は出力に `-lpython3.8` を含まなくなりました。C 拡張モジュールは、`libpython` にリンクされるべきではありません。(スクリプトによって処理される、Android と Cygwin を除く) この変更では、意図的に後方互換性をなくしています。(Victor Stinner の貢献による [bpo-36721](#))

2.5 f-string での = を用いたオブジェクトの表現

フォーマット済み文字列リテラル (f-string) において `=` 指定子が有効になりました。`f'{expr=}'` のような f-string は、f-string に書かれた式、イコール記号、式を評価されたものの文字列表現、の順で表示されます。例えば:

```
>>> user = 'eric_idle'
>>> member_since = date(1975, 7, 31)
>>> f'{user=} {member_since=}'
"user='eric_idle' member_since=datetime.date(1975, 7, 31)"
```

通常の f-string 書式指定子 を用いると、より柔軟に式の結果の表示方法を変えられます:

```
>>> delta = date.today() - member_since
>>> f'{user=!s} {delta.days=:,d}'
'user=eric_idle delta.days=16,075'
```

`=` 指定子は式すべてを表示するので、次のような計算も表示できます:

```
>>> print(f'{theta=} {cos(radians(theta))=:.3f}')
theta=30 cos(radians(theta))=0.866
```

(Eric V. Smith, Larry Hastings の貢献による [bpo-36817](#))

2.6 PEP 578: Python ランタイムの監査フック

この PEP は、監査用フックと信頼された Open のためのフックを追加します。これらは Python およびネイティブコードから利用できます。純粋に Python で書かれたフレームワークやアプリケーションはコードに関する追加情報を得ることができ、システム管理者や埋め込みでの利用者は Python のビルドを常に監査が有効な状態で利用できます。

詳細は [PEP 578](#) を参照してください。

2.7 PEP 587: Python 初期化設定

[PEP 587](#) による C API の改善により、Python 初期化時に、すべての初期化設定に対するより良い制御と改善されたエラー報告が得られます。

新たな構造体:

- PyConfig
- PyPreConfig
- PyStatus
- PyWideStringList

新たな関数:

- PyConfig_Clear()
- PyConfig_InitIsolatedConfig()
- PyConfig_InitPythonConfig()
- PyConfig_Read()
- PyConfig_SetArgv()
- PyConfig_SetBytesArgv()
- PyConfig_SetBytesString()
- PyConfig_SetString()
- PyPreConfig_InitIsolatedConfig()
- PyPreConfig_InitPythonConfig()
- PyStatus_Error()
- PyStatus_Exception()

- `PyStatus_Exit()`
- `PyStatus_IsError()`
- `PyStatus_IsExit()`
- `PyStatus_NoMemory()`
- `PyStatus_Ok()`
- `PyWideStringList_Append()`
- `PyWideStringList_Insert()`
- `Py_BytesMain()`
- `Py_ExitStatusException()`
- `Py_InitializeFromConfig()`
- `Py_PreInitialize()`
- `Py_PreInitializeFromArgs()`
- `Py_PreInitializeFromBytesArgs()`
- `Py_RunMain()`

この PEP は、`_PyRuntimeState.preconfig` (`PyPreConfig` 型) と `PyInterpreterState.config` (`PyConfig` 型) を内部構造体に加えます。`PyInterpreterState.config` は新たな参照設定となり、グローバル設定や他の内部変数を置き換えます。

Python 初期化設定 も参照してください。

詳細は [PEP 587](#) を参照してください。

(Victor Stinner の貢献による [bpo-36763](#))

2.8 Vectorcall: CPython のための高速なプロトコル呼び出し

”vectorcall” プロトコルが Python/C API に追加されました。これには、様々なクラスがすでに実装している最適化を共通の形式にする目的があります。呼び出し可能な形式 (callable) を使用しているすべての拡張モジュールは、このプロトコルを使用できます。

これは現在、暫定版です。Python3.9 から公開で使われることを目指しています。

詳細は [PEP 590](#) を参照してください。

(Jeroen Demeyer, Mark Shannon の貢献による [bpo-36974](#))

2.9 Pickle プロトコルバージョン 5 による帯域外データバッファ

`pickle` モジュールが Python のプロセス間での大容量データ転送でマルチコアないしマルチマシンでの利点を得るためには、メモリコピーの削減のほか、データ種別に応じた圧縮などの個別に合わせた最適化が重要です。

`pickle` プロトコルバージョン 5 は、**PEP 3118** 互換であるようなデータが、メインの `pickle` ストリームとは別の独立した通信レイヤで転送されるような、帯域外バッファを提供します。

詳細は **PEP 574** を参照してください。

(Antoine Pitrou の貢献による [bpo-36785](#))

3 その他の言語変更

- 実装上の問題により、`finally` 節での `continue` 文は不正でした。Python3.8 では、この制限は取り除かれています。(Serhiy Storchaka の貢献による [bpo-32489](#))
- `bool`, `int`, `fractions.Fraction` タイプは、`float` や `decimal.Decimal` と同様の `as_integer_ratio()` メソッドを持つようになりました。この API の拡張によって、`numerator, denominator = x.as_integer_ratio()` のようなコードがより多くの数値型で動作します。(Lisa Roach の貢献による [bpo-33073](#) および Raymond Hettinger の貢献による [bpo-37819](#))
- `int`, `float`, `complex` のコンストラクタは、可能ならば `__index__()` 特殊メソッドを利用し、その場合は対応する `__int__()`, `__float__()` や `__complex__()` は使用できません。(Serhiy Storchaka の貢献による [bpo-20092](#))
- `regular expressions` での `\N{name}` エスケープの追加:

```
>>> notice = 'Copyright © 2019'
>>> copyright_year_pattern = re.compile(r'\N{copyright sign}\s*(\d{4})')
>>> int(copyright_year_pattern.search(notice).group(1))
2019
```

(Jonathan Eunice, Serhiy Storchaka の貢献による [bpo-30688](#))

- `dict` と `dictview` は、`reversed()` を使って逆順でイテレートすることが可能になりました。(Rémi Lapeyre の貢献による [bpo-33462](#))
- 関数内でのキーワード名に関する構文の制限が強化されました。具体的には、`f((keyword)=arg)` の表現が許容されなくなりました。キーワード引数への代入の際、左側にキーワードそのまま以外の表現を許可する意図は、以前からありませんでした。(Benjamin Peterson の貢献による [bpo-34641](#))
- `yield` 文と `return` 文における一般化されたイテラブルへの展開のために、全体を覆うかっこが不要になりました。これは `yield` と `return` の表現を、一般の展開と同様のわかりやすい形式にします:

```
>>> def parse(family):
    lastname, *members = family.split()
    return lastname.upper(), *members

>>> parse('simpsons homer marge bart lisa sally')
('SIMPSONS', 'homer', 'marge', 'bart', 'lisa', 'sally')
```

(David Cuthbert, Jordan Chapman の貢献による [bpo-32117](#))

- [(10, 20) (30, 40)] のようなコードでコンマが無い場合、コンパイラは `SyntaxWarning` を、分かりやすい形式で表示します。これで、最初のタプルが呼び出し可能ではないことを `TypeError` で表示するよりもわかりやすくなります。(Serhiy Storchaka の貢献による [bpo-15248](#))
- `datetime.date`, `datetime.datetime`, `datetime.timedelta` オブジェクトのサブクラス間の算術演算は、基底クラスではなくサブクラスのインスタンスを返すようになりました。この変更は、`astimezone()` のような、`datetime.timedelta` に対する算術演算を直接ないし間接的に使用する実装の戻り値の型に影響します。(Paul Ganssle の貢献による [bpo-32417](#))
- Python インタープリタが Ctrl-C (SIGINT) によって中断され、`KeyboardInterrupt` 例外の結果が捕捉されなかった場合、Python プロセスは SIGINT シグナルか、呼び出したプロセスが、Ctrl-C によって終了したことを判別できるような適切な終了コードで終了するようになりました。POSIX と Windows 上のシェルは、非対話セッション内でスクリプトの終了処理を適切に行うために、これを利用できます。(Gregory P. Smith を通して Google の貢献による [bpo-1054041](#))
- 先進的なプログラミングにおいて、既存の関数の `types.CodeType` オブジェクトを更新する必要性が生じます。code オブジェクトはイミュータブルなので、既存のオブジェクトがあるにもかかわらず、新しい code オブジェクトを生成する必要がありました。パラメータが 19 もあるので、一から作成するのは非合理的です。新しい `replace()` メソッドを使えば、更新すべきパラメータを書くだけで、新しいクローンを作成することができます。

ここでは、`statistics.mean()` 関数がキーワード引数として `data` を使えないように変更する例を見てみましょう:

```
>>> from statistics import mean
>>> mean(data=[10, 20, 90])
40
>>> mean.__code__ = mean.__code__.replace(co_posonlyargcount=1)
>>> mean(data=[10, 20, 90])
Traceback (most recent call last):
...
TypeError: mean() got some positional-only arguments passed as keyword arguments: 'data'
```

(Victor Stinner の貢献による [bpo-37032](#))

- For integers, the three-argument form of the `pow()` function now permits the exponent to be negative in the case where the base is relatively prime to the modulus. It then computes a modular inverse to

the base when the exponent is -1 , and a suitable power of that inverse for other negative exponents. For example, to compute the modular multiplicative inverse of 38 modulo 137, write:

```
>>> pow(38, -1, 137)
119
>>> 119 * 38 % 137
1
```

Modular inverses arise in the solution of linear Diophantine equations. For example, to find integer solutions for $4258x + 147y = 369$, first rewrite as $4258x \equiv 369 \pmod{147}$ then solve:

```
>>> x = 369 * pow(4258, -1, 147) % 147
>>> y = (4258 * x - 369) // -147
>>> 4258 * x + 147 * y
369
```

(Mark Dickinson の貢献による [bpo-36027](#))

- 辞書内包表現は辞書リテラルと同期されたため、まずキーが解釈され、次に値が解釈されます:

```
>>> # Dict comprehension
>>> cast = {input('role? '): input('actor? ') for i in range(2)}
role? King Arthur
actor? Chapman
role? Black Knight
actor? Cleese

>>> # Dict literal
>>> cast = {input('role? '): input('actor? ')}
role? Sir Robin
actor? Eric Idle
```

この実行順の保証は代入式の役に立ち、キーの表現で代入されたものは、値の表現で使うことができます:

```
>>> names = ['Martin von Löwis', 'Łukasz Langa', 'Walter Dörwald']
>>> {(n := normalize('NFC', name)).casefold(): n for name in names}
{'martin von löwis': 'Martin von Löwis',
 'łukasz langa': 'Łukasz Langa',
 'walter dörwald': 'Walter Dörwald'}
```

(Jörn Heissler の貢献による [bpo-35224](#))

- The `object.__reduce__()` method can now return a tuple from two to six elements long. Formerly, five was the limit. The new, optional sixth element is a callable with a `(obj, state)` signature. This allows the direct control over the state-updating behavior of a specific object. If not `None`, this callable will have priority over the object's `__setstate__()` method. (Contributed by Pierre Glaser

and Olivier Grisel in [bpo-35900](#).)

4 新たなモジュール

- 新しい `importlib.metadata` モジュールは、サードパーティパッケージからのメタデータ読み込みをサポートします。これは暫定版です。例えば、インストールされたパッケージのバージョンを得たり、エントリーポイントの一覧を得たりできます:

```
>>> # Note following example requires that the popular "requests"
>>> # package has been installed.
>>>
>>> from importlib.metadata import version, requires, files
>>> version('requests')
'2.22.0'
>>> list(requires('requests'))
['chardet (<3.1.0,>=3.0.2)']
>>> list(files('requests'))[:5]
[PackagePath('requests-2.22.0.dist-info/INSTALLER'),
 PackagePath('requests-2.22.0.dist-info/LICENSE'),
 PackagePath('requests-2.22.0.dist-info/METADATA'),
 PackagePath('requests-2.22.0.dist-info/RECORD'),
 PackagePath('requests-2.22.0.dist-info/WHEEL')]
```

(Barry Warsaw, Jason R. Coombs の貢献による [bpo-34632](#))

5 改良されたモジュール

5.1 ast

AST ノードは `end_lineno` と `end_col_offset` の属性を持つようになりました。これは、正確なノードの終端位置を提供します。(これは、`lineno` と `col_offset` の属性を持つノードにのみ有効です)

新しい `ast.get_source_segment()` 関数は、特定の AST ノードのソースコードを返します。

(Ivan Levkivskyi の貢献による [bpo-33416](#))

`ast.parse()` 関数の新しいフラグが有効になりました:

- `type_comments=True` は、その AST ノードに関連する、**PEP 484** と **PEP 526** に規定されるような型コメントを返します;
- `mode='func_type'` can be used to parse **PEP 484** "signature type comments" (returned for function definition AST nodes);

- `feature_version=(3, N)` を使うと、以前の Python 3 バージョンを指定できます。例えば、`feature_version=(3, 4)` とすると、`async` と `await` キーワードは、予約語ではないとして扱われます。

(Guido van Rossum の貢献による [bpo-35766](#))

5.2 asyncio

`asyncio.run()` は暫定から安定 API に移動しました。この関数は coroutine の実行と、イベントループを管理しながら自動的に結果を返すことに使用できます。例えば:

```
import asyncio

async def main():
    await asyncio.sleep(0)
    return 42

asyncio.run(main())
```

これは、だいたい次と等価です

```
import asyncio

async def main():
    await asyncio.sleep(0)
    return 42

loop = asyncio.new_event_loop()
asyncio.set_event_loop(loop)
try:
    loop.run_until_complete(main())
finally:
    asyncio.set_event_loop(None)
    loop.close()
```

実装はこれよりもずっと複雑なものになっています。ですが、`asyncio.run()` は非同期 IO プログラムを動かす際にまず選ぶべき選択肢です。

(Yury Selivanov の貢献による [bpo-32314](#))

`python -m asyncio` を実行すると、ネイティブ `async` 対話型インタプリタが起動します。高水準キーワード `await` を使うコードの試験を簡単に行えます。すべての呼び出しに対して新しいイベントループを作る `asyncio.run()` を呼び出す必要はありません:

```
$ python -m asyncio
asyncio REPL 3.8.0
```

(次のページに続く)

```

Use "await" directly instead of "asyncio.run()".
Type "help", "copyright", "credits" or "license" for more information.
>>> import asyncio
>>> await asyncio.sleep(10, result='hello')
hello

```

(Yury Selivanov の貢献による [bpo-37028](#))

The exception `asyncio.CancelledError` now inherits from `BaseException` rather than `Exception` and no longer inherits from `concurrent.futures.CancelledError`. (Contributed by Yury Selivanov in [bpo-32528](#).)

Windows では、イベントループのデフォルトが `ProactorEventLoop` になりました。(Victor Stinner の貢献による [bpo-34687](#))

`ProactorEventLoop` は UDP もサポートするようになりました。(Adam Meily, Andrew Svetlov の貢献による [bpo-29883](#))

`ProactorEventLoop` は `KeyboardInterrupt` ("CTRL+C") によって中断できるようになりました。(Vladimir Matveev の貢献による [bpo-23057](#))

`asyncio.Task` 内で、内包されたコルーチンを得られる `asyncio.Task.get_coro()` メソッドが追加されました。(Alex Grönholm の貢献による [bpo-36999](#))

`asyncio.create_task()` 関数か `create_task()` の `name` 引数を指定するか、もしくはタスクに対して `set_name()` メソッドを呼ぶことによって、`asyncio` タスクに名前をつけることができます。タスクの名前は、`asyncio.Task` の `repr()` 出力で、または `get_name()` メソッドで確認することができます。(Alex Grönholm の貢献による [bpo-34270](#))

`asyncio.loop.create_connection()` は、[Happy Eyeballs](#) をサポートするようになりました。挙動を定義するため、2つの新しいパラメータ: `happy_eyeballs_delay` と `interleave` が加えられます。Happy Eyeballs アルゴリズムは、アプリケーションが IPv4 と IPv6 をサポートする場合、その両方を使って接続を保つことによって、アプリケーションの応答性を向上させます。(twisteroid ambassador の貢献による [bpo-33530](#))

5.3 builtins

組み込み関数 `compile()` が、`ast.PyCF_ALLOW_TOP_LEVEL_AWAIT` フラグを受け取るようになりました。このフラグが有効である場合、`compile()` は、一般には有効な公文ではない、トップレベルの `await`, `async for`, `async with` 構文が有効になります。この場合、`CO_COROUTINE` フラグを持つ非同期コードオブジェクトが返されるでしょう。(Matthias Bussonnier の貢献による [bpo-34616](#))

5.4 collections

`collections.namedtuple()` の `_asdict()` メソッドは、`collections.OrderedDict` ではなく `dict` を返すようになりました。Python 3.7 からは一般に辞書の順番が保証されるため、このような変更が可能です。`OrderedDict` 特有の機能を使いたい場合は、結果を `OrderedDict(nt._asdict())` 型にキャストして使用することを推奨します。(Raymond Hettinger の貢献による [bpo-35864](#))

5.5 cProfile

`cProfile.Profile` クラスは、コンテキストマネージャとして使用できるようになりました。このようにしてコードブロックをプロファイルします:

```
import cProfile

with cProfile.Profile() as profiler:
    # code to be profiled
    ...
```

(Scott Sanderson の貢献による [bpo-29235](#))

5.6 csv

`csv.DictReader` は、`collections.OrderedDict` ではなく `dict` のインスタンスを返すようになりました。この変更によって、順序を保ちながら、より高速にかつメモリの使用量を減らして実行できます。(Michael Selik の貢献による [bpo-34003](#))

5.7 curses

`ncurses` ライブラリの、構造化されたバージョン情報を保持する変数を追加しました: `ncurses_version` (Serhiy Storchaka の貢献による [bpo-31680](#))

5.8 ctypes

Windows では、CDLL とそのサブクラスが `winmode` 引数を受け取り、根底の `LoadLibraryEx` 呼び出しのフラグを指定できるようになりました。デフォルトでは、フラグは (フルパスか部分パスが初期 DLL を読み込むのに使われていた場合) その DLL が保存されている場所を含んだ信頼済みの場所と、`add_dll_directory()` によって加えられた場所からのみ、DLL を読み込むようになっています。(Steve Dower の貢献による [bpo-36085](#))

5.9 datetime

ISO の規定に沿った年、週番号、曜日によって、`date` や `datetime` オブジェクトを作成するメソッド `datetime.date.fromisocalendar()` と `datetime.datetime.fromisocalendar()` が追加されました; これは、各クラスの `isocalendar` メソッドの逆を行うものです。(Paul Ganssle の貢献による [bpo-36004](#))

5.10 functools

`functools.lru_cache()` は、デコレータを返す関数としての使い方に加えて、デコレータそのものとしても使えるようになりました。両方の使い方ができます:

```
@lru_cache
def f(x):
    ...

@lru_cache(maxsize=256)
def f(x):
    ...
```

(Raymond Hettinger の貢献による [bpo-36772](#))

インスタンスが存在する間、計算型プロパティをキャッシュする `functools.cached_property()` デコレータが追加されました:

```
import functools
import statistics

class Dataset:
    def __init__(self, sequence_of_numbers):
        self.data = sequence_of_numbers

    @functools.cached_property
    def variance(self):
        return statistics.variance(self.data)
```

(Carl Meyer の貢献による [bpo-21145](#))

`single dispatch` を利用して、メソッドをジェネリック関数に変換する `functools singledispatchmethod()` デコレータが追加されました:

```
from functools import singledispatchmethod
from contextlib import suppress

class TaskManager:
```

(次のページに続く)

(前のページからの続き)

```
def __init__(self, tasks):
    self.tasks = list(tasks)

@singledispatchmethod
def discard(self, value):
    with suppress(ValueError):
        self.tasks.remove(value)

@discard.register(list)
def _(self, tasks):
    targets = set(tasks)
    self.tasks = [x for x in self.tasks if x not in targets]
```

(Ethan Smith の貢献による [bpo-32380](#))

5.11 gc

`get_objects()` は、オブジェクトを得る世代を指定するオプションのパラメータ引数 *generation* を受け取るようになりました。(Pablo Galindo の貢献による [bpo-36016](#))

5.12 gettext

`pgettext()` を含む、類似のいくつかの関数が追加されました。(Franz Glasner, Éric Araujo, Cheryl Sabella の貢献による [bpo-2504](#))

5.13 gzip

出力の再現性のために、`gzip.compress()` に *mtime* パラメータが追加されました。(Guo Ci Teo の貢献による [bpo-34898](#))

不正な、あるいは破損した `gzip` ファイルのうち、所定の種類のものについて、`OSError` にかわって `BadGzipFile` 例外が送出されるようになりました。(Filip Gruszczyński, Michele Orrù, Zackery Spytz の貢献による [bpo-6584](#))

5.14 IDLE と idelilib

Output over N lines (50 by default) is squeezed down to a button. N can be changed in the PyShell section of the General page of the Settings dialog. Fewer, but possibly extra long, lines can be squeezed by right clicking on the output. Squeezed output can be expanded in place by double-clicking the button or into the clipboard or a separate window by right-clicking the button. (Contributed by Tal Einat in [bpo-1529353](#).)

Add "Run Customized" to the Run menu to run a module with customized settings. Any command line arguments entered are added to sys.argv. They also re-appear in the box for the next customized run. One can also suppress the normal Shell main module restart. (Contributed by Cheryl Sabella, Terry Jan Reedy, and others in [bpo-5680](#) and [bpo-37627](#).)

Added optional line numbers for IDLE editor windows. Windows open without line numbers unless set otherwise in the General tab of the configuration dialog. Line numbers for an existing window are shown and hidden in the Options menu. (Contributed by Tal Einat and Saimadhav Heblikar in [bpo-17535](#).)

OS native encoding is now used for converting between Python strings and Tcl objects. This allows IDLE to work with emoji and other non-BMP characters. These characters can be displayed or copied and pasted to or from the clipboard. Converting strings from Tcl to Python and back now never fails. (Many people worked on this for eight years but the problem was finally solved by Serhiy Storchaka in [bpo-13153](#).)

New in 3.8.1:

Add option to toggle cursor blink off. (Contributed by Zackery Spytz in [bpo-4603](#).)

Escape key now closes IDLE completion windows. (Contributed by Johnny Najera in [bpo-38944](#).)

上で挙げた変更は 3.7 のメンテナンスリリースにバックポートされました。

Add keywords to module name completion list. (Contributed by Terry J. Reedy in [bpo-37765](#).)

5.15 inspect

`inspect.getdoc()` 関数は、`__slots__` 属性に値が docstrings であるような dict がある場合、docstrings の内容を探索できるようになりました。これは、既に `property()`、`classmethod()`、`staticmethod()` に現在あるような、ドキュメント生成の選択肢を提供します:

```
class AudioClip:
    __slots__ = {'bit_rate': 'expressed in kilohertz to one decimal place',
                 'duration': 'in seconds, rounded up to an integer'}
    def __init__(self, bit_rate, duration):
        self.bit_rate = round(bit_rate / 1000.0, 1)
        self.duration = ceil(duration)
```

(Raymond Hettinger の貢献による [bpo-36326](#))

5.16 io

In development mode (`-X env`) and in debug build, the `io.IOBase` finalizer now logs the exception if the `close()` method fails. The exception is ignored silently by default in release build. (Contributed by Victor Stinner in [bpo-18748](#).)

5.17 itertools

`itertools.accumulate()` 関数に、初期値を定める、オプションの `initial` キーワード引数が追加されました:

```
>>> from itertools import accumulate
>>> list(accumulate([10, 5, 30, 15], initial=1000))
[1000, 1010, 1015, 1045, 1060]
```

(Lisa Roach の貢献による [bpo-34659](#))

5.18 json.tool

一行ごとに別々の JSON オブジェクトへ解析をする `--json-lines` オプションが追加されました。(Weipeng Hong の貢献による [bpo-31553](#))

5.19 logging

`logging.basicConfig()` に `force` キーワード引数が追加されました。これが真になっている場合、ルートのコネクターに取り付けられたハンドラは全て取り除かれ、他の引数によって指定された設定が有効になる前に閉じられます。

This solves a long-standing problem. Once a logger or `basicConfig()` had been called, subsequent calls to `basicConfig()` were silently ignored. This made it difficult to update, experiment with, or teach the various logging configuration options using the interactive prompt or a Jupyter notebook.

(Suggested by Raymond Hettinger, implemented by Dong-hee Na, and reviewed by Vinay Sajip in [bpo-33897](#).)

5.20 math

二点間のユークリッド距離を計算する `math.dist()` 関数が追加されました。(Raymond Hettinger の貢献による [bpo-33089](#))

`math.hypot()` 関数は、3 次元以上を扱えるように拡張されました。以前は、二次元の場合のみに対応していました。(Raymond Hettinger の貢献による [bpo-33089](#))

`sum()` に類似する関数として、初期値 (デフォルトは 1) に対してイテレート可能なオブジェクトの数を掛けていく `math.prod()` 関数が追加されました:

```
>>> prior = 0.8
>>> likelihoods = [0.625, 0.84, 0.30]
>>> math.prod(likelihoods, start=prior)
0.126
```

(Pablo Galindo の貢献による [bpo-35606](#))

2 つの組み合わせの関数 `math.perm()` と `math.comb()` が追加されました:

```
>>> math.perm(10, 3)      # Permutations of 10 things taken 3 at a time
720
>>> math.comb(10, 3)     # Combinations of 10 things taken 3 at a time
120
```

(Yash Aggarwal, Keller Fuchs, Serhiy Storchaka, Raymond Hettinger の貢献による [bpo-37128](#), [bpo-37178](#), [bpo-35431](#))

浮動小数点数を介することなく、正確な整数の二乗根を計算する関数 `math.isqrt()` が追加されました。この関数は、巨大な整数にも使用できます。`floor(sqrt(n))` より高速ですが、`math.sqrt()` より少し遅いです:

```
>>> r = 650320427
>>> s = r ** 2
>>> isqrt(s - 1)          # correct
650320426
>>> floor(sqrt(s - 1))    # incorrect
650320427
```

(Mark Dickinson の貢献による [bpo-36887](#))

`math.factorial()` 関数は、引数に `int`、またはそれに類似するもの以外を受け取らなくなりました。(Pablo Galindo の貢献による [bpo-33083](#))

5.21 mmap

The `mmap.mmap` class now has an `advise()` method to access the `advise()` system call. (Contributed by Zackery Spytz in [bpo-32941](#).)

5.22 multiprocessing

Added new `multiprocessing.shared_memory` module. (Contributed by Davin Potts in [bpo-35813](#).)

On macOS, the `spawn` start method is now used by default. (Contributed by Victor Stinner in [bpo-33725](#).)

5.23 os

Added new function `add_dll_directory()` on Windows for providing additional search paths for native dependencies when importing extension modules or loading DLLs using `ctypes`. (Contributed by Steve Dower in [bpo-36085](#).)

A new `os.memfd_create()` function was added to wrap the `memfd_create()` syscall. (Contributed by Zackery Spytz and Christian Heimes in [bpo-26836](#).)

On Windows, much of the manual logic for handling reparse points (including symlinks and directory junctions) has been delegated to the operating system. Specifically, `os.stat()` will now traverse anything supported by the operating system, while `os.lstat()` will only open reparse points that identify as "name surrogates" while others are opened as for `os.stat()`. In all cases, `stat_result.st_mode` will only have `S_IFLNK` set for symbolic links and not other kinds of reparse points. To identify other kinds of reparse point, check the new `stat_result.st_reparse_tag` attribute.

On Windows, `os.readlink()` is now able to read directory junctions. Note that `islink()` will return `False` for directory junctions, and so code that checks `islink` first will continue to treat junctions as directories, while code that handles errors from `os.readlink()` may now treat junctions as links.

(Contributed by Steve Dower in [bpo-37834](#).)

As of 3.8.20, `os.mkdir()` and `os.makedirs()` on Windows now support passing a `mode` value of `0o700` to apply access control to the new directory. This implicitly affects `tempfile.mkdtemp()` and is a mitigation for CVE-2024-4030. Other values for `mode` continue to be ignored. (Contributed by Steve Dower in [gh-118486](#).)

5.24 os.path

`os.path` functions that return a boolean result like `exists()`, `lexists()`, `isdir()`, `isfile()`, `islink()`, and `ismount()` now return `False` instead of raising `ValueError` or its subclasses `UnicodeEncodeError` and `UnicodeDecodeError` for paths that contain characters or bytes unrepresentable at the OS level. (Contributed by Serhiy Storchaka in [bpo-33721](#).)

`expanduser()` on Windows now prefers the `USERPROFILE` environment variable and does not use `HOME`, which is not normally set for regular user accounts. (Contributed by Anthony Sottile in [bpo-36264](#).)

`isdir()` on Windows no longer returns `True` for a link to a non-existent directory.

`realpath()` on Windows now resolves reparse points, including symlinks and directory junctions.

(Contributed by Steve Dower in [bpo-37834](#).)

5.25 pathlib

`pathlib.Path` methods that return a boolean result like `exists()`, `is_dir()`, `is_file()`, `is_mount()`, `is_symlink()`, `is_block_device()`, `is_char_device()`, `is_fifo()`, `is_socket()` now return `False` instead of raising `ValueError` or its subclass `UnicodeEncodeError` for paths that contain characters unrepresentable at the OS level. (Contributed by Serhiy Storchaka in [bpo-33721](#).)

Added `pathlib.Path.link_to()` which creates a hard link pointing to a path. (Contributed by Joanna Nanjey in [bpo-26978](#))

5.26 pickle

`pickle` extensions subclassing the C-optimized `Pickler` can now override the pickling logic of functions and classes by defining the special `reducer_override()` method. (Contributed by Pierre Glaser and Olivier Grisel in [bpo-35900](#).)

5.27 plistlib

Added new `plistlib.UID` and enabled support for reading and writing `NSKeyedArchiver`-encoded binary plists. (Contributed by Jon Janzen in [bpo-26707](#).)

5.28 pprint

The `pprint` module added a `sort_dicts` parameter to several functions. By default, those functions continue to sort dictionaries before rendering or printing. However, if `sort_dicts` is set to `false`, the dictionaries retain the order that keys were inserted. This can be useful for comparison to JSON inputs during debugging.

In addition, there is a convenience new function, `pprint.pp()` that is like `pprint.pprint()` but with `sort_dicts` defaulting to `False`:

```
>>> from pprint import pprint, pp
>>> d = dict(source='input.txt', operation='filter', destination='output.txt')
>>> pp(d, width=40)                # Original order
{'source': 'input.txt',
 'operation': 'filter',
 'destination': 'output.txt'}
>>> pprint(d, width=40)            # Keys sorted alphabetically
{'destination': 'output.txt',
 'operation': 'filter',
 'source': 'input.txt'}
```

(Contributed by Rémi Lapeyre in [bpo-30670](#).)

5.29 py_compile

`py_compile.compile()` now supports silent mode. (Contributed by Joannah Nanjey in [bpo-22640](#).)

5.30 shlex

The new `shlex.join()` function acts as the inverse of `shlex.split()`. (Contributed by Bo Bayles in [bpo-32102](#).)

5.31 shutil

`shutil.copytree()` now accepts a new `dirs_exist_ok` keyword argument. (Contributed by Josh Bronson in [bpo-20849](#).)

`shutil.make_archive()` now defaults to the modern pax (POSIX.1-2001) format for new archives to improve portability and standards conformance, inherited from the corresponding change to the `tarfile` module. (Contributed by C.A.M. Gerlach in [bpo-30661](#).)

`shutil.rmtree()` on Windows now removes directory junctions without recursively removing their contents first. (Contributed by Steve Dower in [bpo-37834](#).)

5.32 socket

Added `create_server()` and `has_dualstack_ipv6()` convenience functions to automate the necessary tasks usually involved when creating a server socket, including accepting both IPv4 and IPv6 connections on the same socket. (Contributed by Giampaolo Rodolà in [bpo-17561](#).)

The `socket.if_nameindex()`, `socket.if_nametoindex()`, and `socket.if_indextoname()` functions have been implemented on Windows. (Contributed by Zackery Spytz in [bpo-37007](#).)

5.33 ssl

Added `post_handshake_auth` to enable and `verify_client_post_handshake()` to initiate TLS 1.3 post-handshake authentication. (Contributed by Christian Heimes in [bpo-34670](#).)

5.34 statistics

Added `statistics.fmean()` as a faster, floating point variant of `statistics.mean()`. (Contributed by Raymond Hettinger and Steven D'Aprano in [bpo-35904](#).)

Added `statistics.geometric_mean()` (Contributed by Raymond Hettinger in [bpo-27181](#).)

Added `statistics.multimode()` that returns a list of the most common values. (Contributed by Raymond Hettinger in [bpo-35892](#).)

Added `statistics.quantiles()` that divides data or a distribution in to equiprobable intervals (e.g. quartiles, deciles, or percentiles). (Contributed by Raymond Hettinger in [bpo-36546](#).)

Added `statistics.NormalDist`, a tool for creating and manipulating normal distributions of a random variable. (Contributed by Raymond Hettinger in [bpo-36018](#).)

```
>>> temperature_feb = NormalDist.from_samples([4, 12, -3, 2, 7, 14])
>>> temperature_feb.mean
6.0
>>> temperature_feb.stdev
6.356099432828281

>>> temperature_feb.cdf(3)           # Chance of being under 3 degrees
0.3184678262814532
>>> # Relative chance of being 7 degrees versus 10 degrees
>>> temperature_feb.pdf(7) / temperature_feb.pdf(10)
1.2039930378537762

>>> el_niño = NormalDist(4, 2.5)
>>> temperature_feb += el_niño       # Add in a climate effect
```

(次のページに続く)

```
>>> temperature_feb
NormalDist(mu=10.0, sigma=6.830080526611674)

>>> temperature_feb * (9/5) + 32      # Convert to Fahrenheit
NormalDist(mu=50.0, sigma=12.294144947901014)

>>> temperature_feb.samples(3)        # Generate random samples
[7.672102882379219, 12.000027119750287, 4.647488369766392]
```

5.35 sys

Add new `sys.unraisablehook()` function which can be overridden to control how "unraisable exceptions" are handled. It is called when an exception has occurred but there is no way for Python to handle it. For example, when a destructor raises an exception or during garbage collection (`gc.collect()`). (Contributed by Victor Stinner in [bpo-36829](#).)

5.36 tarfile

The `tarfile` module now defaults to the modern pax (POSIX.1-2001) format for new archives, instead of the previous GNU-specific one. This improves cross-platform portability with a consistent encoding (UTF-8) in a standardized and extensible format, and offers several other benefits. (Contributed by C.A.M. Gerlach in [bpo-36268](#).)

5.37 tempfile

As of 3.8.20 on Windows, the default mode `0o700` used by `tempfile.mkdtemp()` now limits access to the new directory due to changes to `os.mkdir()`. This is a mitigation for CVE-2024-4030. (Contributed by Steve Dower in [gh-118486](#).)

5.38 threading

Add a new `threading.excepthook()` function which handles uncaught `threading.Thread.run()` exception. It can be overridden to control how uncaught `threading.Thread.run()` exceptions are handled. (Contributed by Victor Stinner in [bpo-1230540](#).)

Add a new `threading.get_native_id()` function and a `native_id` attribute to the `threading.Thread` class. These return the native integral Thread ID of the current thread assigned by the kernel. This feature is only available on certain platforms, see `get_native_id` for more information. (Contributed by Jake Tesler in [bpo-36084](#).)

5.39 tokenize

The `tokenize` module now implicitly emits a `NEWLINE` token when provided with input that does not have a trailing new line. This behavior now matches what the C tokenizer does internally. (Contributed by Ammar Askar in [bpo-33899](#).)

5.40 tkinter

Added methods `selection_from()`, `selection_present()`, `selection_range()` and `selection_to()` in the `tkinter.Spinbox` class. (Contributed by Juliette Monsel in [bpo-34829](#).)

Added method `moveto()` in the `tkinter.Canvas` class. (Contributed by Juliette Monsel in [bpo-23831](#).)

The `tkinter.PhotoImage` class now has `transparency_get()` and `transparency_set()` methods. (Contributed by Zackery Spytz in [bpo-25451](#).)

5.41 time

Added new clock `CLOCK_UPTIME_RAW` for macOS 10.12. (Contributed by Joannah Nanjeyke in [bpo-35702](#).)

5.42 typing

The `typing` module incorporates several new features:

- A dictionary type with per-key types. See [PEP 589](#) and `typing.TypedDict`. `TypedDict` uses only string keys. By default, every key is required to be present. Specify `"total=False"` to allow keys to be optional:

```
class Location(TypedDict, total=False):
    lat_long: tuple
    grid_square: str
    xy_coordinate: tuple
```

- Literal types. See [PEP 586](#) and `typing.Literal`. Literal types indicate that a parameter or return value is constrained to one or more specific literal values:

```
def get_status(port: int) -> Literal['connected', 'disconnected']:
    ...
```

- "Final" variables, functions, methods and classes. See [PEP 591](#), `typing.Final` and `typing.final()`. The final qualifier instructs a static type checker to restrict subclassing, overriding, or reassignment:

```
pi: Final[float] = 3.1415926536
```

- Protocol definitions. See [PEP 544](#), `typing.Protocol` and `typing.runtime_checkable()`. Simple ABCs like `typing.SupportsInt` are now Protocol subclasses.
- New protocol class `typing.SupportsIndex`.
- New functions `typing.get_origin()` and `typing.get_args()`.

5.43 unicodedata

The `unicodedata` module has been upgraded to use the [Unicode 12.1.0](#) release.

New function `is_normalized()` can be used to verify a string is in a specific normal form, often much faster than by actually normalizing the string. (Contributed by Max Belanger, David Euresti, and Greg Price in [bpo-32285](#) and [bpo-37966](#)).

5.44 unittest

Added `AsyncMock` to support an asynchronous version of `Mock`. Appropriate new assert functions for testing have been added as well. (Contributed by Lisa Roach in [bpo-26467](#)).

Added `addModuleCleanup()` and `addClassCleanup()` to `unittest` to support cleanups for `setUpModule()` and `setUpClass()`. (Contributed by Lisa Roach in [bpo-24412](#).)

Several mock assert functions now also print a list of actual calls upon failure. (Contributed by Petter Strandmark in [bpo-35047](#).)

`unittest` module gained support for coroutines to be used as test cases with `unittest.IsolatedAsyncioTestCase`. (Contributed by Andrew Svetlov in [bpo-32972](#).)

以下はプログラム例です:

```
import unittest

class TestRequest(unittest.IsolatedAsyncioTestCase):

    async def asyncSetUp(self):
        self.connection = await AsyncConnection()

    async def test_get(self):
        response = await self.connection.get("https://example.com")
        self.assertEqual(response.status_code, 200)
```

(次のページに続く)

```
async def asyncTearDown(self):
    await self.connection.close()

if __name__ == "__main__":
    unittest.main()
```

5.45 venv

`venv` now includes an `Activate.ps1` script on all platforms for activating virtual environments under PowerShell Core 6.1. (Contributed by Brett Cannon in [bpo-32718](#).)

5.46 weakref

The proxy objects returned by `weakref.proxy()` now support the matrix multiplication operators `@` and `@=` in addition to the other numeric operators. (Contributed by Mark Dickinson in [bpo-36669](#).)

5.47 xml

As mitigation against DTD and external entity retrieval, the `xml.dom.minidom` and `xml.sax` modules no longer process external entities by default. (Contributed by Christian Heimes in [bpo-17239](#).)

The `.find*()` methods in the `xml.etree.ElementTree` module support wildcard searches like `{*}tag` which ignores the namespace and `{namespace}*` which returns all tags in the given namespace. (Contributed by Stefan Behnel in [bpo-28238](#).)

The `xml.etree.ElementTree` module provides a new function - `xml.etree.ElementTree.canonicalize()` that implements C14N 2.0. (Contributed by Stefan Behnel in [bpo-13611](#).)

The target object of `xml.etree.ElementTree.XMLParser` can receive namespace declaration events through the new callback methods `start_ns()` and `end_ns()`. Additionally, the `xml.etree.ElementTree.TreeBuilder` target can be configured to process events about comments and processing instructions to include them in the generated tree. (Contributed by Stefan Behnel in [bpo-36676](#) and [bpo-36673](#).)

5.48 xmlrpc

`xmlrpc.client.ServerProxy` now supports an optional *headers* keyword argument for a sequence of HTTP headers to be sent with each request. Among other things, this makes it possible to upgrade from default basic authentication to faster session authentication. (Contributed by Cédric Krier in [bpo-35153](#).)

6 最適化

- The `subprocess` module can now use the `os.posix_spawn()` function in some cases for better performance. Currently, it is only used on macOS and Linux (using glibc 2.24 or newer) if all these conditions are met:

- `close_fds` is false;
- `preexec_fn`, `pass_fds`, `cwd` and `start_new_session` parameters are not set;
- the `executable` path contains a directory.

(Contributed by Joanna Nanjey and Victor Stinner in [bpo-35537](#).)

- `shutil.copyfile()`, `shutil.copy()`, `shutil.copy2()`, `shutil.copytree()` and `shutil.move()` use platform-specific "fast-copy" syscalls on Linux and macOS in order to copy the file more efficiently. "fast-copy" means that the copying operation occurs within the kernel, avoiding the use of userspace buffers in Python as in `"outfd.write(infd.read())"`. On Windows `shutil.copyfile()` uses a bigger default buffer size (1 MiB instead of 16 KiB) and a `memoryview()`-based variant of `shutil.copyfileobj()` is used. The speedup for copying a 512 MiB file within the same partition is about +26% on Linux, +50% on macOS and +40% on Windows. Also, much less CPU cycles are consumed. See `shutil-platform-dependent-efficient-copy-operations` section. (Contributed by Giampaolo Rodolà in [bpo-33671](#).)
- `shutil.copytree()` uses `os.scandir()` function and all copy functions depending from it use cached `os.stat()` values. The speedup for copying a directory with 8000 files is around +9% on Linux, +20% on Windows and +30% on a Windows SMB share. Also the number of `os.stat()` syscalls is reduced by 38% making `shutil.copytree()` especially faster on network filesystems. (Contributed by Giampaolo Rodolà in [bpo-33695](#).)
- The default protocol in the `pickle` module is now Protocol 4, first introduced in Python 3.4. It offers better performance and smaller size compared to Protocol 3 available since Python 3.0.
- Removed one `Py_ssize_t` member from `PyGC_Head`. All GC tracked objects (e.g. tuple, list, dict) size is reduced 4 or 8 bytes. (Contributed by Inada Naoki in [bpo-33597](#).)
- `uuid.UUID` now uses `__slots__` to reduce its memory footprint. (Contributed by Wouter Bolsterlee and Tal Einat in [bpo-30977](#))

- Improved performance of `operator.itemgetter()` by 33%. Optimized argument handling and added a fast path for the common case of a single non-negative integer index into a tuple (which is the typical use case in the standard library). (Contributed by Raymond Hettinger in [bpo-35664](#).)
- Sped-up field lookups in `collections.namedtuple()`. They are now more than two times faster, making them the fastest form of instance variable lookup in Python. (Contributed by Raymond Hettinger, Pablo Galindo, and Joe Jevnik, Serhiy Storchaka in [bpo-32492](#).)
- The `list` constructor does not overallocate the internal item buffer if the input iterable has a known length (the input implements `__len__`). This makes the created list 12% smaller on average. (Contributed by Raymond Hettinger and Pablo Galindo in [bpo-33234](#).)
- Doubled the speed of class variable writes. When a non-dunder attribute was updated, there was an unnecessary call to update slots. (Contributed by Stefan Behnel, Pablo Galindo Salgado, Raymond Hettinger, Neil Schemenauer, and Serhiy Storchaka in [bpo-36012](#).)
- Reduced an overhead of converting arguments passed to many builtin functions and methods. This sped up calling some simple builtin functions and methods up to 20--50%. (Contributed by Serhiy Storchaka in [bpo-23867](#), [bpo-35582](#) and [bpo-36127](#).)
- `LOAD_GLOBAL` instruction now uses new "per opcode cache" mechanism. It is about 40% faster now. (Contributed by Yury Selivanov and Inada Naoki in [bpo-26219](#).)

7 ビルドならびに C API の変更

- Default `sys.abiflags` became an empty string: the `m` flag for pymalloc became useless (builds with and without pymalloc are ABI compatible) and so has been removed. (Contributed by Victor Stinner in [bpo-36707](#).)

Example of changes:

- Only `python3.8` program is installed, `python3.8m` program is gone.
- Only `python3.8-config` script is installed, `python3.8m-config` script is gone.
- The `m` flag has been removed from the suffix of dynamic library filenames: extension modules in the standard library as well as those produced and installed by third-party packages, like those downloaded from PyPI. On Linux, for example, the Python 3.7 suffix `.cpython-37m-x86_64-linux-gnu.so` became `.cpython-38-x86_64-linux-gnu.so` in Python 3.8.
- The header files have been reorganized to better separate the different kinds of APIs:
 - `Include/*.h` should be the portable public stable C API.

- `Include/cpython/*.h` should be the unstable C API specific to CPython; public API, with some private API prefixed by `_Py` or `_PY`.
- `Include/internal/*.h` is the private internal C API very specific to CPython. This API comes with no backward compatibility warranty and should not be used outside CPython. It is only exposed for very specific needs like debuggers and profiles which has to access to CPython internals without calling functions. This API is now installed by `make install`.

(Contributed by Victor Stinner in [bpo-35134](#) and [bpo-35081](#), work initiated by Eric Snow in Python 3.7.)

- Some macros have been converted to static inline functions: parameter types and return type are well defined, they don't have issues specific to macros, variables have a local scopes. Examples:

- `Py_INCREF()`, `Py_DECREF()`
- `Py_XINCREF()`, `Py_XDECREF()`
- `PyObject_INIT()`, `PyObject_INIT_VAR()`
- Private functions: `_PyObject_GC_TRACK()`, `_PyObject_GC_UNTRACK()`, `_Py_Dealloc()`

(Contributed by Victor Stinner in [bpo-35059](#).)

- The `PyByteArray_Init()` and `PyByteArray_Fini()` functions have been removed. They did nothing since Python 2.7.4 and Python 3.2.0, were excluded from the limited API (stable ABI), and were not documented. (Contributed by Victor Stinner in [bpo-35713](#).)
- The result of `PyExceptionClass_Name()` is now of type `const char *` rather of `char *`. (Contributed by Serhiy Storchaka in [bpo-33818](#).)
- The duality of `Modules/Setup.dist` and `Modules/Setup` has been removed. Previously, when updating the CPython source tree, one had to manually copy `Modules/Setup.dist` (inside the source tree) to `Modules/Setup` (inside the build tree) in order to reflect any changes upstream. This was of a small benefit to packagers at the expense of a frequent annoyance to developers following CPython development, as forgetting to copy the file could produce build failures.

Now the build system always reads from `Modules/Setup` inside the source tree. People who want to customize that file are encouraged to maintain their changes in a git fork of CPython or as patch files, as they would do for any other change to the source tree.

(Contributed by Antoine Pitrou in [bpo-32430](#).)

- Functions that convert Python number to C integer like `PyLong_AsLong()` and argument parsing functions like `PyArg_ParseTuple()` with integer converting format units like `'i'` will now use the `__index__()` special method instead of `__int__()`, if available. The deprecation warning will be emitted for objects with the `__int__()` method but without the `__index__()` method (like

Decimal and Fraction). `PyNumber_Check()` will now return 1 for objects implementing `__index__()`. `PyNumber_Long()`, `PyNumber_Float()` and `PyFloat_AsDouble()` also now use the `__index__()` method if available. (Contributed by Serhiy Storchaka in [bpo-36048](#) and [bpo-20092](#).)

- Heap-allocated type objects will now increase their reference count in `PyObject_Init()` (and its parallel macro `PyObject_INIT`) instead of in `PyType_GenericAlloc()`. Types that modify instance allocation or deallocation may need to be adjusted. (Contributed by Eddie Elizondo in [bpo-35810](#).)
- The new function `PyCode_NewWithPosOnlyArgs()` allows to create code objects like `PyCode_New()`, but with an extra *posonlyargcount* parameter for indicating the number of positional-only arguments. (Contributed by Pablo Galindo in [bpo-37221](#).)
- `Py_SetPath()` now sets `sys.executable` to the program full path (`Py_GetProgramFullPath()`) rather than to the program name (`Py_GetProgramName()`). (Contributed by Victor Stinner in [bpo-38234](#).)

8 非推奨

- The distutils `bdist_wininst` command is now deprecated, use `bdist_wheel` (wheel packages) instead. (Contributed by Victor Stinner in [bpo-37481](#).)
- Deprecated methods `getchildren()` and `getiterator()` in the `ElementTree` module now emit a `DeprecationWarning` instead of `PendingDeprecationWarning`. They will be removed in Python 3.9. (Contributed by Serhiy Storchaka in [bpo-29209](#).)
- Passing an object that is not an instance of `concurrent.futures.ThreadPoolExecutor` to `loop.set_default_executor()` is deprecated and will be prohibited in Python 3.9. (Contributed by Elvis Pranskevichus in [bpo-34075](#).)
- The `__getitem__()` methods of `xml.dom.pulldom.DOMEventStream`, `wsgiref.util.FileWrapper` and `fileinput.FileInput` have been deprecated.

Implementations of these methods have been ignoring their *index* parameter, and returning the next item instead. (Contributed by Berker Peksag in [bpo-9372](#).)

- The `typing.NamedTuple` class has deprecated the `_field_types` attribute in favor of the `__annotations__` attribute which has the same information. (Contributed by Raymond Hettinger in [bpo-36320](#).)
- `ast` classes `Num`, `Str`, `Bytes`, `NameConstant` and `Ellipsis` are considered deprecated and will be removed in future Python versions. `Constant` should be used instead. (Contributed by Serhiy Storchaka in [bpo-32892](#).)
- `ast.NodeVisitor` methods `visit_Num()`, `visit_Str()`, `visit_Bytes()`, `visit_NameConstant()` and `visit_Ellipsis()` are deprecated now and will not be called in future Python versions. Add

the `visit_Constant()` method to handle all constant nodes. (Contributed by Serhiy Storchaka in [bpo-36917](#).)

- The `asyncio.coroutine()` decorator is deprecated and will be removed in version 3.10. Instead of `@asyncio.coroutine`, use `async def` instead. (Contributed by Andrew Svetlov in [bpo-36921](#).)
- In `asyncio`, the explicit passing of a *loop* argument has been deprecated and will be removed in version 3.10 for the following: `asyncio.sleep()`, `asyncio.gather()`, `asyncio.shield()`, `asyncio.wait_for()`, `asyncio.wait()`, `asyncio.as_completed()`, `asyncio.Task`, `asyncio.Lock`, `asyncio.Event`, `asyncio.Condition`, `asyncio.Semaphore`, `asyncio.BoundedSemaphore`, `asyncio.Queue`, `asyncio.create_subprocess_exec()`, and `asyncio.create_subprocess_shell()`.
- The explicit passing of coroutine objects to `asyncio.wait()` has been deprecated and will be removed in version 3.11. (Contributed by Yury Selivanov in [bpo-34790](#).)
- The following functions and methods are deprecated in the `gettext` module: `lgettext()`, `ldgettext()`, `lngettext()` and `ldngettext()`. They return encoded bytes, and it's possible that you will get unexpected Unicode-related exceptions if there are encoding problems with the translated strings. It's much better to use alternatives which return Unicode strings in Python 3. These functions have been broken for a long time.

Function `bind_textdomain_codeset()`, methods `output_charset()` and `set_output_charset()`, and the *codeset* parameter of functions `translation()` and `install()` are also deprecated, since they are only used for the *l*gettext()* functions. (Contributed by Serhiy Storchaka in [bpo-33710](#).)

- The `isAlive()` method of `threading.Thread` has been deprecated. (Contributed by Dong-hee Na in [bpo-35283](#).)
- Many builtin and extension functions that take integer arguments will now emit a deprecation warning for `Decimals`, `Fractions` and any other objects that can be converted to integers only with a loss (e.g. that have the `__int__()` method but do not have the `__index__()` method). In future version they will be errors. (Contributed by Serhiy Storchaka in [bpo-36048](#).)
- Deprecated passing the following arguments as keyword arguments:
 - *func* in `functools.partialmethod()`, `weakref.finalize()`, `profile.Profile.runcall()`, `cProfile.Profile.runcall()`, `bdb.Bdb.runcall()`, `trace.Trace.runfunc()` and `curses.wrapper()`.
 - *function* in `unittest.TestCase.addCleanup()`.
 - *fn* in the `submit()` method of `concurrent.futures.ThreadPoolExecutor` and `concurrent.futures.ProcessPoolExecutor`.
 - *callback* in `contextlib.ExitStack.callback()`, `contextlib.AsyncExitStack.callback()` and `contextlib.AsyncExitStack.push_async_callback()`.

- `c` and `typeid` in the `create()` method of `multiprocessing.managers.Server` and `multiprocessing.managers.SharedMemoryServer`.
- `obj` in `weakref.finalize()`.

In future releases of Python, they will be positional-only. (Contributed by Serhiy Storchaka in [bpo-36492](#).)

9 API と機能の削除

The following features and APIs have been removed from Python 3.8:

- Starting with Python 3.3, importing ABCs from `collections` was deprecated, and importing should be done from `collections.abc`. Being able to import from `collections` was marked for removal in 3.8, but has been delayed to 3.9. (See [bpo-36952](#).)
- The `macpath` module, deprecated in Python 3.7, has been removed. (Contributed by Victor Stinner in [bpo-35471](#).)
- The function `platform.popen()` has been removed, after having been deprecated since Python 3.3: use `os.popen()` instead. (Contributed by Victor Stinner in [bpo-35345](#).)
- The function `time.clock()` has been removed, after having been deprecated since Python 3.3: use `time.perf_counter()` or `time.process_time()` instead, depending on your requirements, to have well-defined behavior. (Contributed by Matthias Bussonnier in [bpo-36895](#).)
- The `pyvenv` script has been removed in favor of `python3.8 -m venv` to help eliminate confusion as to what Python interpreter the `pyvenv` script is tied to. (Contributed by Brett Cannon in [bpo-25427](#).)
- `parse_qs`, `parse_qs1`, and `escape` are removed from the `cgi` module. They are deprecated in Python 3.2 or older. They should be imported from the `urllib.parse` and `html` modules instead.
- `filemode` function is removed from the `tarfile` module. It is not documented and deprecated since Python 3.3.
- The `XMLParser` constructor no longer accepts the `html` argument. It never had an effect and was deprecated in Python 3.4. All other parameters are now keyword-only. (Contributed by Serhiy Storchaka in [bpo-29209](#).)
- Removed the `doctype()` method of `XMLParser`. (Contributed by Serhiy Storchaka in [bpo-29209](#).)
- "unicode_internal" codec is removed. (Contributed by Inada Naoki in [bpo-36297](#).)
- The `Cache` and `Statement` objects of the `sqlite3` module are not exposed to the user. (Contributed by Aviv Palivoda in [bpo-30262](#).)

- The `bufsize` keyword argument of `fileinput.input()` and `fileinput.FileInput()` which was ignored and deprecated since Python 3.6 has been removed. [bpo-36952](#) (Contributed by Matthias Bussonnier.)
- The functions `sys.set_coroutine_wrapper()` and `sys.get_coroutine_wrapper()` deprecated in Python 3.7 have been removed; [bpo-36933](#) (Contributed by Matthias Bussonnier.)

10 Python 3.8 への移植

このセクションでは前述の変更とバグフィックスにより必要となるかもしれないコードの変更を列挙します:

10.1 Python の挙動の変更

- Yield expressions (both `yield` and `yield from` clauses) are now disallowed in comprehensions and generator expressions (aside from the iterable expression in the leftmost `for` clause). (Contributed by Serhiy Storchaka in [bpo-10544](#).)
- The compiler now produces a `SyntaxWarning` when identity checks (`is` and `is not`) are used with certain types of literals (e.g. strings, numbers). These can often work by accident in CPython, but are not guaranteed by the language spec. The warning advises users to use equality tests (`==` and `!=`) instead. (Contributed by Serhiy Storchaka in [bpo-34850](#).)
- The CPython interpreter can swallow exceptions in some circumstances. In Python 3.8 this happens in fewer cases. In particular, exceptions raised when getting the attribute from the type dictionary are no longer ignored. (Contributed by Serhiy Storchaka in [bpo-35459](#).)
- Removed `__str__` implementations from builtin types `bool`, `int`, `float`, `complex` and few classes from the standard library. They now inherit `__str__()` from `object`. As result, defining the `__repr__()` method in the subclass of these classes will affect their string representation. (Contributed by Serhiy Storchaka in [bpo-36793](#).)
- On AIX, `sys.platform` doesn't contain the major version anymore. It is always `'aix'`, instead of `'aix3' .. 'aix7'`. Since older Python versions include the version number, so it is recommended to always use `sys.platform.startswith('aix')`. (Contributed by M. Felt in [bpo-36588](#).)
- `PyEval_AcquireLock()` and `PyEval_AcquireThread()` now terminate the current thread if called while the interpreter is finalizing, making them consistent with `PyEval_RestoreThread()`, `Py_END_ALLOW_THREADS()`, and `PyGILState_Ensure()`. If this behavior is not desired, guard the call by checking `_Py_IsFinalizing()` or `sys.is_finalizing()`. (Contributed by Joanna Nanjeyye in [bpo-36475](#).)

10.2 Python API の変更

- The `os.getcwd()` function now uses the UTF-8 encoding on Windows, rather than the ANSI code page: see [PEP 529](#) for the rationale. The function is no longer deprecated on Windows. (Contributed by Victor Stinner in [bpo-37412](#).)
- `subprocess.Popen` can now use `os.posix_spawn()` in some cases for better performance. On Windows Subsystem for Linux and QEMU User Emulation, the `Popen` constructor using `os.posix_spawn()` no longer raises an exception on errors like "missing program". Instead the child process fails with a non-zero `returncode`. (Contributed by Joanna Nanjey and Victor Stinner in [bpo-35537](#).)
- The `preexec_fn` argument of `* subprocess.Popen` is no longer compatible with subinterpreters. The use of the parameter in a subinterpreter now raises `RuntimeError`. (Contributed by Eric Snow in [bpo-34651](#), modified by Christian Heimes in [bpo-37951](#).)
- The `imap.IMAP4.logout()` method no longer silently ignores arbitrary exceptions. (Contributed by Victor Stinner in [bpo-36348](#).)
- The function `platform.popen()` has been removed, after having been deprecated since Python 3.3: use `os.popen()` instead. (Contributed by Victor Stinner in [bpo-35345](#).)
- The `statistics.mode()` function no longer raises an exception when given multimodal data. Instead, it returns the first mode encountered in the input data. (Contributed by Raymond Hettinger in [bpo-35892](#).)
- The `selection()` method of the `tkinter.ttk.Treeview` class no longer takes arguments. Using it with arguments for changing the selection was deprecated in Python 3.6. Use specialized methods like `selection_set()` for changing the selection. (Contributed by Serhiy Storchaka in [bpo-31508](#).)
- The `writexml()`, `toxml()` and `toprettyxml()` methods of `xml.dom.minidom`, and the `write()` method of `xml.etree`, now preserve the attribute order specified by the user. (Contributed by Diego Rojas and Raymond Hettinger in [bpo-34160](#).)
- A `dbm.dumb` database opened with flags `'r'` is now read-only. `dbm.dumb.open()` with flags `'r'` and `'w'` no longer creates a database if it does not exist. (Contributed by Serhiy Storchaka in [bpo-32749](#).)
- The `doctype()` method defined in a subclass of `XMLParser` will no longer be called and will emit a `RuntimeWarning` instead of a `DeprecationWarning`. Define the `doctype()` method on a target for handling an XML doctype declaration. (Contributed by Serhiy Storchaka in [bpo-29209](#).)
- A `RuntimeError` is now raised when the custom metaclass doesn't provide the `__classcell__` entry in the namespace passed to `type.__new__`. A `DeprecationWarning` was emitted in Python 3.6--3.7. (Contributed by Serhiy Storchaka in [bpo-23722](#).)

- The `cProfile.Profile` class can now be used as a context manager. (Contributed by Scott Sanderson in [bpo-29235](#).)
- `shutil.copyfile()`, `shutil.copy()`, `shutil.copy2()`, `shutil.copytree()` and `shutil.move()` use platform-specific "fast-copy" syscalls (see [shutil-platform-dependent-efficient-copy-operations](#) section).
- `shutil.copyfile()` default buffer size on Windows was changed from 16 KiB to 1 MiB.
- The `PyGC_Head` struct has changed completely. All code that touched the struct member should be rewritten. (See [bpo-33597](#).)
- The `PyInterpreterState` struct has been moved into the "internal" header files (specifically `Include/internal/pycore_pystate.h`). An opaque `PyInterpreterState` is still available as part of the public API (and stable ABI). The docs indicate that none of the struct's fields are public, so we hope no one has been using them. However, if you do rely on one or more of those private fields and have no alternative then please open a BPO issue. We'll work on helping you adjust (possibly including adding accessor functions to the public API). (See [bpo-35886](#).)
- The `mmap.flush()` method now returns `None` on success and raises an exception on error under all platforms. Previously, its behavior was platform-dependent: a nonzero value was returned on success; zero was returned on error under Windows. A zero value was returned on success; an exception was raised on error under Unix. (Contributed by Berker Peksag in [bpo-2122](#).)
- `xml.dom.minidom` and `xml.sax` modules no longer process external entities by default. (Contributed by Christian Heimes in [bpo-17239](#).)
- Deleting a key from a read-only `dbm` database (`dbm.dumb`, `dbm.gnu` or `dbm.ndbm`) raises `error` (`dbm.dumb.error`, `dbm.gnu.error` or `dbm.ndbm.error`) instead of `KeyError`. (Contributed by Xiang Zhang in [bpo-33106](#).)
- Simplified AST for literals. All constants will be represented as `ast.Constant` instances. Instantiating old classes `Num`, `Str`, `Bytes`, `NameConstant` and `Ellipsis` will return an instance of `Constant`. (Contributed by Serhiy Storchaka in [bpo-32892](#).)
- `expanduser()` on Windows now prefers the `USERPROFILE` environment variable and does not use `HOME`, which is not normally set for regular user accounts. (Contributed by Anthony Sottile in [bpo-36264](#).)
- The exception `asyncio.CancelledError` now inherits from `BaseException` rather than `Exception` and no longer inherits from `concurrent.futures.CancelledError`. (Contributed by Yury Selivanov in [bpo-32528](#).)
- The function `asyncio.wait_for()` now correctly waits for cancellation when using an instance of `asyncio.Task`. Previously, upon reaching `timeout`, it was cancelled and immediately returned. (Contributed by Elvis Pranskevichus in [bpo-32751](#).)
- The function `asyncio.BaseTransport.get_extra_info()` now returns a safe to use socket object

when 'socket' is passed to the *name* parameter. (Contributed by Yuri Selivanov in [bpo-37027](#).)

- `asyncio.BufferedProtocol` has graduated to the stable API.
- DLL dependencies for extension modules and DLLs loaded with `ctypes` on Windows are now resolved more securely. Only the system paths, the directory containing the DLL or PYD file, and directories added with `add_dll_directory()` are searched for load-time dependencies. Specifically, `PATH` and the current working directory are no longer used, and modifications to these will no longer have any effect on normal DLL resolution. If your application relies on these mechanisms, you should check for `add_dll_directory()` and if it exists, use it to add your DLLs directory while loading your library. Note that Windows 7 users will need to ensure that Windows Update KB2533623 has been installed (this is also verified by the installer). (Contributed by Steve Dower in [bpo-36085](#).)
- The header files and functions related to `pgen` have been removed after its replacement by a pure Python implementation. (Contributed by Pablo Galindo in [bpo-36623](#).)
- `types.CodeType` has a new parameter in the second position of the constructor (*posonlyargcount*) to support positional-only arguments defined in [PEP 570](#). The first argument (*argcount*) now represents the total number of positional arguments (including positional-only arguments). The new `replace()` method of `types.CodeType` can be used to make the code future-proof.
- The parameter `digestmod` for `hmac.new()` no longer uses the MD5 digest by default.

10.3 C API の変更

- The `PyCompilerFlags` structure got a new `cf_feature_version` field. It should be initialized to `PY_MINOR_VERSION`. The field is ignored by default, and is used if and only if `PyCF_ONLY_AST` flag is set in `cf_flags`. (Contributed by Guido van Rossum in [bpo-35766](#).)
- The `PyEval_ReInitThreads()` function has been removed from the C API. It should not be called explicitly: use `PyOS_AfterFork_Child()` instead. (Contributed by Victor Stinner in [bpo-36728](#).)
- On Unix, C extensions are no longer linked to `libpython` except on Android and Cygwin. When Python is embedded, `libpython` must not be loaded with `RTLD_LOCAL`, but `RTLD_GLOBAL` instead. Previously, using `RTLD_LOCAL`, it was already not possible to load C extensions which were not linked to `libpython`, like C extensions of the standard library built by the `*shared*` section of `Modules/Setup`. (Contributed by Victor Stinner in [bpo-21536](#).)
- Use of `#` variants of formats in parsing or building value (e.g. `PyArg_ParseTuple()`, `Py_BuildValue()`, `PyObject_CallFunction()`, etc.) without `PY_SSIZE_T_CLEAN` defined raises `DeprecationWarning` now. It will be removed in 3.10 or 4.0. Read `arg-parsing` for detail. (Contributed by Inada Naoki in [bpo-36381](#).)
- Instances of heap-allocated types (such as those created with `PyType_FromSpec()`) hold a reference

to their type object. Increasing the reference count of these type objects has been moved from `PyType_GenericAlloc()` to the more low-level functions, `PyObject_Init()` and `PyObject_INIT()`. This makes types created through `PyType_FromSpec()` behave like other classes in managed code.

Statically allocated types are not affected.

For the vast majority of cases, there should be no side effect. However, types that manually increase the reference count after allocating an instance (perhaps to work around the bug) may now become immortal. To avoid this, these classes need to call `Py_DECREF` on the type object during instance deallocation.

To correctly port these types into 3.8, please apply the following changes:

- Remove `Py_INCREF` on the type object after allocating an instance - if any. This may happen after calling `PyObject_New()`, `PyObject_NewVar()`, `PyObject_GC_New()`, `PyObject_GC_NewVar()`, or any other custom allocator that uses `PyObject_Init()` or `PyObject_INIT()`.

例:

```
static foo_struct *
foo_new(PyObject *type) {
    foo_struct *foo = PyObject_GC_New(foo_struct, (PyTypeObject *) type);
    if (foo == NULL)
        return NULL;
    #if PY_VERSION_HEX < 0x03080000
        // Workaround for Python issue 35810; no longer necessary in Python 3.8
        Py_INCREF(type)
    #endif
    return foo;
}
```

- Ensure that all custom `tp_dealloc` functions of heap-allocated types decrease the type's reference count.

例:

```
static void
foo_dealloc(foo_struct *instance) {
    PyObject *type = Py_TYPE(instance);
    PyObject_GC_Del(instance);
    #if PY_VERSION_HEX >= 0x03080000
        // This was not needed before Python 3.8 (Python issue 35810)
        Py_DECREF(type);
    #endif
}
```

(Contributed by Eddie Elizondo in [bpo-35810](#).)

- The `Py_DEPRECATED()` macro has been implemented for MSVC. The macro now must be placed before the symbol name.

例:

```
Py_DEPRECATED(3.8) PyAPI_FUNC(int) Py_OldFunction(void);
```

(Contributed by Zackery Spytz in [bpo-33407](#).)

- The interpreter does not pretend to support binary compatibility of extension types across feature releases, anymore. A `PyTypeObject` exported by a third-party extension module is supposed to have all the slots expected in the current Python version, including `tp_finalize` (`Py_TPFLAGS_HAVE_FINALIZE` is not checked anymore before reading `tp_finalize`).

(Contributed by Antoine Pitrou in [bpo-32388](#).)

- The functions `PyNode_AddChild()` and `PyParser_AddToken()` now accept two additional `int` arguments `end_lineno` and `end_col_offset`.
- The `libpython38.a` file to allow MinGW tools to link directly against `python38.dll` is no longer included in the regular Windows distribution. If you require this file, it may be generated with the `gendef` and `dlltool` tools, which are part of the MinGW binutils package:

```
gendef - python38.dll > tmp.def
dlltool --dllname python38.dll --def tmp.def --output-lib libpython38.a
```

The location of an installed `pythonXY.dll` will depend on the installation options and the version and language of Windows. See [using-on-windows](#) for more information. The resulting library should be placed in the same directory as `pythonXY.lib`, which is generally the `libs` directory under your Python installation.

(Contributed by Steve Dower in [bpo-37351](#).)

10.4 CPython バイトコードの変更

- The interpreter loop has been simplified by moving the logic of unrolling the stack of blocks into the compiler. The compiler emits now explicit instructions for adjusting the stack of values and calling the cleaning-up code for `break`, `continue` and `return`.

Removed opcodes `BREAK_LOOP`, `CONTINUE_LOOP`, `SETUP_LOOP` and `SETUP_EXCEPT`. Added new opcodes `ROT_FOUR`, `BEGIN_FINALLY`, `CALL_FINALLY` and `POP_FINALLY`. Changed the behavior of `END_FINALLY` and `WITH_CLEANUP_START`.

(Contributed by Mark Shannon, Antoine Pitrou and Serhiy Storchaka in [bpo-17611](#).)

- Added new opcode `END_ASYNC_FOR` for handling exceptions raised when awaiting a next item in an `async for` loop. (Contributed by Serhiy Storchaka in [bpo-33041](#).)
- The `MAP_ADD` now expects the value as the first element in the stack and the key as the second element. This change was made so the key is always evaluated before the value in dictionary comprehensions, as proposed by [PEP 572](#). (Contributed by Jörn Heissler in [bpo-35224](#).)

10.5 Demos and Tools

Added a benchmark script for timing various ways to access variables: `Tools/scripts/var_access_benchmark.py`. (Contributed by Raymond Hettinger in [bpo-35884](#).)

Here's a summary of performance improvements since Python 3.3:

Python version	3.3	3.4	3.5	3.6	3.7	3.8
-----	---	---	---	---	---	---
Variable and attribute read access:						
<code>read_local</code>	4.0	7.1	7.1	5.4	5.1	3.9
<code>read_nonlocal</code>	5.3	7.1	8.1	5.8	5.4	4.4
<code>read_global</code>	13.3	15.5	19.0	14.3	13.6	7.6
<code>read_builtin</code>	20.0	21.1	21.6	18.5	19.0	7.5
<code>read_classvar_from_class</code>	20.5	25.6	26.5	20.7	19.5	18.4
<code>read_classvar_from_instance</code>	18.5	22.8	23.5	18.8	17.1	16.4
<code>read_instancevar</code>	26.8	32.4	33.1	28.0	26.3	25.4
<code>read_instancevar_slots</code>	23.7	27.8	31.3	20.8	20.8	20.2
<code>read_namedtuple</code>	68.5	73.8	57.5	45.0	46.8	18.4
<code>read_boundmethod</code>	29.8	37.6	37.9	29.6	26.9	27.7
Variable and attribute write access:						
<code>write_local</code>	4.6	8.7	9.3	5.5	5.3	4.3
<code>write_nonlocal</code>	7.3	10.5	11.1	5.6	5.5	4.7
<code>write_global</code>	15.9	19.7	21.2	18.0	18.0	15.8
<code>write_classvar</code>	81.9	92.9	96.0	104.6	102.1	39.2
<code>write_instancevar</code>	36.4	44.6	45.8	40.0	38.9	35.5
<code>write_instancevar_slots</code>	28.7	35.6	36.1	27.3	26.6	25.7
Data structure read access:						
<code>read_list</code>	19.2	24.2	24.5	20.8	20.8	19.0
<code>read_deque</code>	19.9	24.7	25.5	20.2	20.6	19.8
<code>read_dict</code>	19.7	24.3	25.7	22.3	23.0	21.0
<code>read_strdict</code>	17.9	22.6	24.3	19.5	21.2	18.9
Data structure write access:						
<code>write_list</code>	21.2	27.1	28.5	22.5	21.6	20.0
<code>write_deque</code>	23.8	28.7	30.1	22.7	21.8	23.5
<code>write_dict</code>	25.9	31.4	33.3	29.3	29.2	24.7

(前のページからの続き)

<code>write_strdict</code>	22.9	28.4	29.9	27.5	25.2	23.1
Stack (or queue) operations:						
<code>list_append_pop</code>	144.2	93.4	112.7	75.4	74.2	50.8
<code>deque_append_pop</code>	30.4	43.5	57.0	49.4	49.2	42.5
<code>deque_append_popleft</code>	30.8	43.7	57.3	49.7	49.7	42.8
Timing loop:						
<code>loop_overhead</code>	0.3	0.5	0.6	0.4	0.3	0.3

The benchmarks were measured on an [Intel® Core™ i7-4960HQ processor](#) running the macOS 64-bit builds found at [python.org](#). The benchmark script displays timings in nanoseconds.

11 Python3.8.1 での重要な変更点

セキュリティ上の重大な懸念により、`asyncio.loop.create_datagram_endpoint()` での `reuse_address` 引数は無効になりました。これはソケットオプション `SO_REUSEADDR` の UDP における挙動が原因です。詳しくは、`loop.create_datagram_endpoint()` のドキュメントを参照してください。(Kyle Stanley, Antoine Pitrou, Yury Selivanov による貢献 [bpo-37228](#))

12 Python3.8.2 での重要な変更点

`shutil.copytree()` における `ignore` コールバックの扱いを再修正しました。コールバックの引数は再び、`str` と `List[str]` になります。(Manuel Barkhau, Giampaolo Rodola の貢献による [bpo-39390](#))

13 Notable changes in Python 3.8.3

The constant values of future flags in the `__future__` module are updated in order to prevent collision with compiler flags. Previously `PyCF_ALLOW_TOP_LEVEL_AWAIT` was clashing with `CO_FUTURE_DIVISION`. (Contributed by Batuhan Taskaya in [bpo-39562](#))

14 Python3.8.8 での重要な変更点

Earlier Python versions allowed using both `;` and `&` as query parameter separators in `urllib.parse.parse_qs()` and `urllib.parse.parse_qsl()`. Due to security concerns, and to conform with newer W3C recommendations, this has been changed to allow only a single separator key, with `&` as the default. This change also affects `cgi.parse()` and `cgi.parse_multipart()` as they use the affected functions internally. For more details, please see their respective documentation. (Contributed by Adam Goldschmidt, Senthil Kumaran and Ken Jin in [bpo-42967](#).)

15 Notable changes in Python 3.8.9

A security fix alters the `ftplib.FTP` behavior to not trust the IPv4 address sent from the remote server when setting up a passive data channel. We reuse the ftp server IP address instead. For unusual code requiring the old behavior, set a `trust_server_pasv_ipv4_address` attribute on your FTP instance to `True`. (See [bpo-43285](#))

16 Notable changes in Python 3.8.10

16.1 macOS 11.0 (Big Sur) と Apple シリコンの Mac のサポート

As of 3.8.10, Python now supports building and running on macOS 11 (Big Sur) and on Apple Silicon Macs (based on the ARM64 architecture). A new universal build variant, `universal2`, is now available to natively support both ARM64 and Intel 64 in one set of executables. Note that support for "weaklinking", building binaries targeted for newer versions of macOS that will also run correctly on older versions by testing at runtime for missing features, is not included in this backport from Python 3.9; to support a range of macOS versions, continue to target for and build on the oldest version in the range.

(Originally contributed by Ronald Oussoren and Lawrence D’Anna in [bpo-41100](#), with fixes by FX Coudert and Eli Rykoff, and backported to 3.8 by Maxime Bélangier and Ned Deily)

17 Notable changes in Python 3.8.10

17.1 urllib.parse

The presence of newline or tab characters in parts of a URL allows for some forms of attacks. Following the WHATWG specification that updates [RFC 3986](#), ASCII newline `\n`, `\r` and tab `\t` characters are stripped from the URL by the parser in `urllib.parse` preventing such attacks. The removal characters are controlled by a new module level variable `urllib.parse._UNSAFE_URL_BYTES_TO_REMOVE`. (See [bpo-43882](#))

18 Notable changes in Python 3.8.12

18.1 Python API の変更

Starting with Python 3.8.12 the `ipaddress` module no longer accepts any leading zeros in IPv4 address strings. Leading zeros are ambiguous and interpreted as octal notation by some libraries. For example the legacy function `socket.inet_aton()` treats leading zeros as octal notation. glibc implementation of modern `inet_pton()` does not accept any leading zeros.

(Originally contributed by Christian Heimes in [bpo-36384](#), and backported to 3.8 by Achraf Merzouki)

19 Notable security feature in 3.8.14

Converting between `int` and `str` in bases other than 2 (binary), 4, 8 (octal), 16 (hexadecimal), or 32 such as base 10 (decimal) now raises a `ValueError` if the number of digits in string form is above a limit to avoid potential denial of service attacks due to the algorithmic complexity. This is a mitigation for [CVE-2020-10735](#). This limit can be configured or disabled by environment variable, command line flag, or `sys` APIs. See the integer string conversion length limitation documentation. The default limit is 4300 digits in string form.

20 Notable Changes in 3.8.17

20.1 tarfile

- The extraction methods in `tarfile`, and `shutil.unpack_archive()`, have a new a *filter* argument that allows limiting tar features than may be surprising or dangerous, such as creating files outside the destination directory. See `tarfile-extraction-filter` for details. In Python 3.12, use without the *filter* argument will show a `DeprecationWarning`. In Python 3.14, the default will switch to `'data'`. (Contributed by Petr Viktorin in [PEP 706](#).)

21 Notable changes in 3.8.20

21.1 ipaddress

- Fixed `is_global` and `is_private` behavior in `IPv4Address`, `IPv6Address`, `IPv4Network` and `IPv6Network`.

21.2 email

- Headers with embedded newlines are now quoted on output.

The `generator` will now refuse to serialize (write) headers that are improperly folded or delimited, such that they would be parsed as multiple headers or joined with adjacent data. If you need to turn this safety feature off, set `verify_generated_headers`. (Contributed by Bas Bloemsaat and Petr Viktorin in [gh-121650](#).)

- `email.utils.getaddresses()` and `email.utils.parseaddr()` now return `(' ', '')` 2-tuples in more situations where invalid email addresses are encountered, instead of potentially inaccurate values. An optional *strict* parameter was added to these two functions: use `strict=False` to get the old behavior, accepting malformed inputs. `getattr(email.utils, 'supports_strict_parsing', False)` can be used to check if the *strict* parameter is available. (Contributed by Thomas Dwyer and Victor Stinner for [gh-102988](#) to improve the CVE-2023-27043 fix.)
